I love the GUI paradigm. Recently I started to use Windows and a shell (as opposed to the command line). The only shell I've ever used is the bash shell. I used to always run command line tools from the command line, but find it cumbersome to keep track of running commands. Recently I decided to write a shell that allowed me to manage running commands as the OS would. For example, instead of having to press "alt-f1" to get to a terminal or "gnome-open" to open a file, I would have the ability to right click and execute a command. I created cyb. It has a command line interface and a graphical interface. The command line is pretty much a normal bash shell. You can execute shell commands as you would and set/clear environment variables, etc. The GUI is designed to feel like a OS shell. It has a file explorer, a tree view, a progress bar, a working dir, etc. It is configurable through a system of preferences and profiles. For example, I can set a profile to open a terminal when I right click on a file, change the working dir and set
